

## Forklift Training Course Guelph

Forklift Training Course Guelph - Federal and industry regulators have established the criteria for forklift safety training according to their existing standards and regulations. Individuals wanting to operate a forklift should complete a forklift training course before utilizing one of these machines. The accredited Forklift Operator Training Program is meant to provide trainees with the practical skills and information to become a forklift operator.

Vehicle and Mobile Equipment safety rules that apply to forklift use include pre-shift inspections, and rules for loading and lifting.

An inspection checklist should be completed and given to the supervising authority prior to starting a shift. When a maintenance problem is uncovered, the utilization of the particular machine must be discontinued until the problem has been addressed. To indicate the equipment is out of order, the keys need to be removed from the ignition and a warning tag placed in a visible location.

Loading safety regulations consist of checking the rating capacity on the forklift nameplate and knowing if the load weight falls within capacity. The forklift forks should be in the downward position when the forklift is starting up. Don't forget that there is a loss of about one hundred pounds carrying capacity for every one inch further away from the carriage which the load is carried.

Lifting must start with the driver moving to a stopped position about three inches from the load. The mast must then be leveled until it has reached a right angle with the load. Lift the forks to an inch under the slot on the pallet and drive forward. After that lift forks four inches. Tilt back the load to secure it for moving. Drive the lift backwards if the load obscures frontal vision. Check behind and honk to alert other staff. Never allow forks to drag on the ground.

Forklift loads must be loaded in such a way that they are secure and do not create a danger to other objects or people. Restraining loads is needed for materials which may shift during transport and destabilize the forklift.

So as to avoid the movement of drums, drums can be strapped together to lessen movement. Operators of forklifts should drive slowly when transporting liquids, to decrease instability in the forklift.
